

Benjamin Wakefield

Full Stack Software Engineer

Portfolio: bwake.dev **LinkedIn:** [benjamin-wakefield](https://www.linkedin.com/in/benjamin-wakefield)
Github: github.com/asynchronous **Email:** bwakefield34@gmail.com **Contact:** 0499794102

Versatile Full Stack Software Engineer with proven experience across cloud migrations, platform modernisation, high-throughput distributed systems, DevOps automation and Spec Driven Development. Recognised for technical breadth and reliability, from delivering scalable backend services in Go and .NET to maintaining React/Typescript frontends. Passionate about designing performant, well-tested solutions, driving cross-team adoption of new tools, and delivering continuous improvement across

Tech Stack

- C#/.Net
- Go
- Typescript
- React/Vite
- GraphQL
- Node/Express
- YAML
- SQL
- Powershell/Bash
- Terminal
- Git/SourceTree
- Docker
- AKS/Kubernetes
- CosmosDB
- SQL-Server
- Terraform
- Scylla
- Kafka

Tools

- Github/ Bitbucket
- Harness
- Jira/Confluence
- Azure Devops
- TeamCity
- Octopus
- Google Cloud
- Azure
- AWS/ECS/S3
- Copilot
- Kiro
- Claude
- NewRelic
- ApplInsights
- Grafana
- VS/VS Code

Employment

Zeroflucs

Oct 2025 – Now

- Spec driven AI Development for all engineering work
- Designed and implemented a progressive parlay pricing engine
- Extended a protobuf code generator with custom serialisation caching and parallel unmarshalling
- Delivered measurable backend performance improvements
- Delivered numerous UI features and bug fixes across the internal react frontend tool
- Improved observability with trace spans, monitoring dashboards
- Created numerous Go microservices to support data ingestion

Domino's Pizza Enterprises Ltd

Mar 2022 – Aug 2025

- Developed scalable .Net 8 services and maintained React frontends
- Assisted with cross-team cloud migration projects (Azure, AWS)
- Automated DevOps pipelines
- Implemented translation workflows
- Enabled cross-team tool adoption
- Migrated platforms to Entra ID
- Built automated SQL pipelines
- Integrated banking backend services
- Improved caching and performance
- Enhanced monitoring and logging
- Planned and executed legacy platform decommissioning

Consultation Manager

May 2021 – Mar 2022

- Junior Software Engineer
- Angular/.Net

Project Highlights

Progressive Parlay Pricing Engine

- Designed and implemented the backend for a progressive parlay pricing engine integrating with existing architecture
- Prices parlays up to 20 legs by computing all outcome combinations with margin; supports cashout, bet shaping, void handling, and same-game parlay legs
- Load tested to p90 < 1s at 1 million requests per minute; delivered with full documentation, dashboarding, component diagrams, and exhaustive test coverage

Backend Performance & Protocol Buffer Extensions

- Extended an open-source protobuf code generator (vtproto) with two custom features: pre-caching of marshalled bytes to eliminate redundant serialisation, and a code-generation annotation to parallelise unmarshalling of collections via goroutines
- Delivered numerous pipeline performance improvements through goroutine parallelisation, instance caching, batching, and gRPC streaming, achieving measurable throughput gains across several services

Front End (React / Vite)

- Implemented a filtering rework: refactored components to share a common base, reworked React context, and delivered multiple new filter types
- Delivered a range of UI bug fixes and consistency improvements across the product

Infrastructure & Stability

- Created a number of Go microservices to support data ingestion following established internal service patterns
- Conducted multiple service stability investigations backed by monitoring, with targeted fixes where required

Project Highlights Cont.

Dominos

Feedback/JSM/ OpenAi Integration

- Implemented middleware solution to integrate third-party platforms with .NET APIs, automating customer feedback handling, and leveraging AI for contextual summarisation. Also contributed to discovery, planning and design of the integration

Microsoft Teams App Banking Integration

- Led the implementation of a full stack banking integration, designing and implementing backend API endpoints in .NET, setting up secure authentication flows, and connecting the app to external financial data providers (Yodlee). Managed data storage using Azure Cosmos DB and Blob Storage, and coordinated frontend integration for React-based SPA with support for access as a Teams App. Ensured compliance with logging, consent, and terms acceptance requirements, and supported testing and deployment in Azure Kubernetes Service (AKS).

Legacy Service Migrations

- Led the migration and modernisation of key legacy services to modern cloud platforms and frameworks. This included:
 - Refactoring and redeploying Backend Services from .Net Framework to .Net 8
 - Migrating CMS platforms to Azure, streamlining authentication, configuration, and deployment processes.
 - Upgrading Backend and GraphQL components to new APIs, enabling feature toggles, enhanced scalability, and staged decommissioning of legacy systems.

Locize to Lokalise Migration

- Automated translation repository migrations and workflows, integrating translation platforms (e.g., Lokalise) with CI/CD pipelines, enabled AI-generated translations, and supported cross-team onboarding.

Older Projects

github.com/asynchronous

Education

Coder Academy – Diploma of IT

Aug 2020 – Feb 2021

- Diploma of Information Technology
- Full Stack Web Dev Bootcamp
- Completed a number of web dev projects featured on the left!

QUT - Bachelors of Business

Jan 2015 – July 2018

- Finance Major
 - Behavioural Science Minor
-
